### Question

Given a noisy point cloud approximation C of a compact set  $K \subset \mathbb{R}^d$ , how can we recover geometric and topological informations about K, such as its curvature, boundaries, Betti numbers, etc. knowing only the point cloud C?

Zhengchao Wan

#### DTM

Offset Reconstruction

DTM signature

Statistical test

End

# Inference using distance functions

One idea to retrieve information of a point cloud is to consider the R-offset of the point cloud - that is the union of balls of radius R whose center lie in the point cloud.

This offset makes good estimation of the topology, normal cones, and curvature measures of the underlying object, shown in previous literature.

<□> <@> < E> < E> E のQ 3/31

The main tool used is a notion of **distance function**.

Zhengchao Wan

### Theorem (DTM stability theorem)

If  $\mu, \nu$  are two probability measures on  $\mathbb{R}^d$  and  $m_0 > 0$ , then

$$\|d_{\mu,m_0} - d_{
u,m_0}\|_\infty \leq rac{1}{\sqrt{m_0}} W_2(\mu,
u).$$

Zhengchao Wan

#### DTM

Offset Reconstruction

DTM signature

Statistical test

End

# Uniform Convergence of DTM

### Lemma

If  $\mu$  is a compactly-supported measure, then  $d_S$  is the uniform limit of  $d_{\mu,m_0}$  as  $m_0$  converges to 0, where  $S = \text{supp}(\mu)$ , i.e.,

$$\lim_{m_0\to 0}\left\|d_{\mu,m_0}-d_{\mathcal{S}}\right\|_{\infty}=0.$$

### Remark

If  $\mu$  has dimension at most k > 0, i.e.  $\mu(B(x, \epsilon)) \ge C\epsilon^k, \forall x \in S$  when  $\epsilon$  is small, then we can control the convergence speed:

$$\|d_{\mu,m_0}-d_S\|_{\infty}=O(m_0^{1/k}).$$

Given two *N*-samples from the mm-spaces  $(X, \delta, \mu), (Y, \gamma, \nu)$ , we want to build a algorithm using these two samples to test the null hypothesis:

 $H_0$  "two mm-spaces X, Y are isomorphic",

against its alternative:

 $H_1$  "two mm-spaces X, Y are not isomorphic",

Zhengchao Wan

DTM

Offset Recon struction

DTM signature

Statistical test

End

The test proposed in the paper is based on the fact that the DTM-signature associated to two isomorphic mm-spaces are equal, which leads to  $W_1(d_{\mu,m}(\mu), d_{\nu,m}(\nu)) = 0$ .

End

Given two *N*-samples from the mm-spaces  $(X, \delta, \mu), (Y, \gamma, \nu)$ , choose randomly two *n*-samples from them respectively, which gives four empirical measures,  $\hat{\mu}_n, \hat{\mu}_N, \hat{\nu}_n, \hat{\nu}_N$ .

**Test statistic**:  $T_{N,n,m}(\mu,\nu) = \sqrt{n}W_1(d_{\hat{\mu}_N,m}(\hat{\mu}_n), d_{\hat{\nu}_N,m}(\hat{\nu}_n)).$ 

Denote the law of  $T_{N,n,m}(\mu,\nu)$  as  $\mathcal{L}_{N,n,m}(\mu,\nu)$ .

Zhengchao Wan

DTM

Offset Recon struction

DTM signature

Statistical test

End

### Lemma

If two mm-spaces are isomorphic, then  $\mathcal{L}_{N,n,m}(\mu,\nu) = \mathcal{L}_{N,n,m}(\nu,\nu) = \mathcal{L}_{N,n,m}(\mu,\mu) = \frac{1}{2}\mathcal{L}_{N,n,m}(\mu,\mu) + \frac{1}{2}\mathcal{L}_{N,n,m}(\nu,\nu).$ 

### Remark

 $\frac{1}{2}\mathcal{L}_{N,n,m}(\mu,\mu) + \frac{1}{2}\mathcal{L}_{N,n,m}(\nu,\nu) \text{ is the distribution of } ZT_{N,n,m}(\mu,\mu) + (1-Z)T_{N,n,m}(\nu,\nu), \text{ where } Z \text{ is another independent random variable with Bernoulli distribution.}$ 

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The  $\alpha$ -quantile  $q_{\alpha,N,n}$  of  $\frac{1}{2}\mathcal{L}_{N,n,m}(\mu,\mu) + \frac{1}{2}\mathcal{L}_{N,n,m}(\nu,\nu)$  will be approximated by the  $\alpha$ -quantile  $\hat{q}_{\alpha,N,n}$  of  $\frac{1}{2}\mathcal{L}_{N,n,m}^{*}(\hat{\mu}_{N},\hat{\mu}_{N}) + \frac{1}{2}\mathcal{L}_{N,n,m}^{*}(\hat{\nu}_{N},\hat{\nu}_{N}).$ 

Here  $\mathcal{L}_{N,n,m}^{*}(\hat{\mu}_{N}, \hat{\mu}_{N})$  stands for the distribution of  $T_{N,n,m}(\hat{\mu}_{N}, \hat{\mu}_{N}) = \sqrt{n} W_{1}(d_{\hat{\mu}_{N},m}(\mu_{n}^{*}), d_{\hat{\mu}_{N},m}(\mu'^{*}_{n}))$  conditionally to  $\hat{\mu}_{N}$ , where  $\mu_{n}^{*}$  and  ${\mu'^{*}}_{n}$  are two independent *n*-samples of law  $\hat{\mu}_{N}$ .

We deal with the **test**:

$$\phi_{N} = \mathbf{1}_{T_{N,n,m}(\mu,\nu) \ge \hat{q}_{\alpha,N,n}}.$$
